Discussions:

1. Structure of the project.
2. Middleware.ts must be global.
3. JWT verification on server side, JWT for both custom login and auth.js login.
4. Handling of JWT for access.
5. Client-side input Form implementation.
6. DB access on server side.
7. Even if I click a route, it not authorized the middleware is called, and if authorization is required.
8. Separate file for protected routes.
9. Research on how the upper level person can give access to lower level, but not vice versa.
10. Client can see the progress or the calender of his project, but the team lead can see the details of multiple projects.
